

Amendments to the Claims:

Please amend the claims as follows:

1. (Currently Amended) A method comprising:
accessing a control register mask;
adjusting a control value for a control register as a function of said control register mask to generate a masked control value, wherein adjusting includes performing a Boolean AND operation in which said control register mask and said control value are operands;
~~programming~~ storing said masked control value into the control register.
2. (Currently Amended) The method of claim 1 further comprising ~~wherein said accessing comprises~~ writing an initial value to at least one address within a memory image.
3. (Currently Amended) The method of claim 2 further comprising ~~wherein said accessing further comprises~~ executing a state save operation.
4. (Currently Amended) The method of claim 3 further comprising ~~wherein said accessing further comprises~~ comparing a saved value to said initial value, said saved value being stored within said memory image as a result of said execution of said state save operation.

5. (Currently Amended) The method of claim 4 wherein said control register mask ~~comprises~~ is set to a default value if said saved value is equal to said initial value.
6. (Currently Amended) The method of claim 5 wherein said control register mask ~~comprises~~ is set to said saved value if said saved value is not equal to said initializing value.
7. (Cancelled)
8. (Currently Amended) The method of claim ~~6~~ 7 wherein said state save operation is an FXSAVE instruction, said FXSAVE instruction having an associated ~~with it~~ a target address.
9. (Currently Amended) The method of claim 8 wherein said target address is an address within said memory image.
10. (Currently Amended) A machine-readable medium having stored thereon a set of instructions said set of instructions, which when executed by a processor, cause said processor to perform a method comprising:
- accessing a control register mask;
 - adjusting a control value for a control register as a function of said control register mask to generate a masked control value, wherein adjusting includes

performing a Boolean AND operation in which said control register mask and said control value are operands;

programming storing said masked control value into the control register.

11. (Currently Amended) The computer-readable medium of claim 10 further comprising ~~wherein said accessing comprises~~ writing an initial value to at least one address within a memory image.

12. (Currently Amended) The computer-readable medium of claim 11 further comprising ~~wherein said accessing further comprises~~ executing a state save operation.

13. (Currently Amended) The computer-readable medium of claim 12 further comprising ~~wherein said accessing further comprises~~ comparing a saved value to said initial value, said saved value being stored within said memory image as a result of said execution of said state save operation.

14. (Currently Amended) The computer-readable medium of claim 13 wherein said control register mask ~~comprises~~ is set to a default value if said saved value is equal to said initial value.

15. (Currently Amended) The computer-readable medium of claim 14 wherein said control register mask ~~comprises~~ is set to said saved value if said saved value is not equal to said initializing value.

16. (Cancelled)

17. (Currently Amended) The computer-readable medium of claim ~~15~~¹⁶ wherein said state save operation is an FXSAVE instruction, said FXSAVE instruction having an associated ~~with it~~ a target address.

18. (Original) The computer-readable medium of claim 17 wherein said target address is an address within said memory image.

19. (Currently Amended) An apparatus comprising:

a control register comprising a plurality of bits corresponding to ~~provide~~ a plurality of functions;

a masking mechanism to generate a control register mask by setting to set ~~to set~~ inactive one or more bits of a control value prior to storage of said one or more bits in the control register; wherein the masking mechanism is to perform a Boolean AND operation in which said control register mask and said control value are operands.

20. (Original) The apparatus of claim 19 further comprising:

a mask storage area to contain a pre-determined mask value, said mask value indicating which of said plurality of functions are available.

21. (Original) The apparatus of claim 20 wherein said mask storage area may be accessed by performing a state saving operation which saves said mask value to a memory location.

22. (Original) The apparatus of claim 21 wherein said state saving operation is an FXSAVE instruction.

23. (Original) The apparatus of claim 19 wherein said masking mechanism is a hardware masking mechanism.

24. (Original) The apparatus of claim 19 wherein said masking mechanism comprises:

a sequence of instruction to adjust a control value by saving state information including a control register value to a memory and adjusting said control register value based on a readable mask value read from the processor before restoring the state information;

execution hardware to execute the sequence of instructions.

25. (Currently Amended) A processor comprising:

a decode unit;

at least one of a plurality of registers, said at least one of a plurality of registers comprising a plurality of bits corresponding to ~~provide~~ a plurality of functions;

a masking mechanism to generate a control register mask by setting to set inactive one or more bits of a control value prior to storage of said one or more bits in the control register; wherein the masking mechanism is to perform a Boolean AND operation in which said control register mask and said control value are operands;

an execution unit;

an internal bus, said decoder unit, said at least one plurality of registers, said at least one execution unit being coupled by said internal bus.

26. (Original) The processor of claim 25, wherein, in response to said execution unit executing an instruction, said plurality of bits are written to a mask storage area.

27. (Original) The processor of claim 26 wherein said instruction is an FXSAVE instruction.

28. (Original) The processor of claim 27 wherein said at least one of a plurality of registers is an MXCSR register.

29. (Currently Amended) The processor of claim 28 wherein said ~~at least one~~ mask storage area is an MXCSR_MASK field.
